

SignalForge

Prediction-market evidence for
bonding-curve rehearsal

Working prototype for the Panta and Meteora sidetracks

SYNTHETIC PANTA DATA / REAL METEORA SDK CALCULATIONS

Evidence and budget assumptions

Launch teams need to see how their assumptions change actual fills.

Market evidence

Panta detail and recent trades
Freshness and activity checks
Missing prices stay visible

Operator assumptions

YES outcome budget: 40,000 USDC
NO outcome budget: 8,000 USDC
A stated reason links event and launch

The demo invents the event and its activity. Market prices cannot establish token demand.

Panta evidence and Meteora execution

01

Capture

Authenticated Panta reads
Bounded catalog pages
Detail and trade snapshots

02

Assess

Active market and freshness
Volume and recent activity
Price-complement checks

03

Simulate

Official Meteora SDK 1.5.13
Three DBC configurations
Independent partial fills

04

Export

HTML and quote CSV
Inputs and configurations
Replayable JSON report

Every quote starts from the same empty pool. Simulation ends at migration.

Curve shape changes the 40,000 USDC fill

20,000 USDC initial cap / 200,000 USDC migration cap / 1% fixed fee

Curve	Used USDC	Fee USDC	Unspent USDC	Migration
Constant liquidity	40000	400	0	82.4%
Front-weighted liquidity	38870.109491	388.701095	1129.890509	Reached
Back-weighted liquidity	40000	400	0	67.0%

The front-weighted profile reaches migration with 1,129.890509 USDC unused.

A reviewer can reproduce every result

23

tests pass

```
npm ci  
npm test  
npm run demo
```

Exact input and fee conservation
Independent integer quote check
Missing and stale evidence
API failures and altered reports

**Full replay matches the saved report.
Browser checks cover charts and scenario
details.**

Next proof and entry requirements

Live Panta evidence

An authorized key, relevant market and fresh capture

Human entry

Eligibility review, registration and official submissions

Usage evidence

Launch-team feedback and mainnet traction remain unproven
